

# Energy efficient doors and windows

All homes lose heat through their windows and doors but energy efficient glazing is a way to keep your home warmer, quieter and reduce your energy bills.

Energy-efficient glazing is the term used to describe double or triple glazing:

**Double glazing** – A window with two sheets of glass with a gap in between each sheet of glass.

**Triple glazing** – A window with three sheets of glass with a gap

between each sheet of glass.

Doors can also be draught proofed. Having properly fitted new external doors that are insulated and draught-proof would keep your home warmer and more energy efficient.

## What are the benefits of having energy efficient doors and windows?

- Reduce energy bills
- Reduce carbon footprints
- Creates a more comfortable home. It will be warmer and quieter
- Reduced condensation. Upgrading your windows and doors can reduce condensation build up on the inside of the panes

## FAQs

### Who will pay for the installation of my energy efficient windows and doors?

Moat would pay for the installation of more energy efficient windows and doors for your home.
